Dr. Eric L. Hoffman

A Tribute to Dr. Eric Laurence Hoffman

Eric Laurence Hoffman, Ph.D, P.Geo, President and founder of Activation Laboratories Ltd. (Actlabs), passed away on July 10, 2015.

Eric was an economic geologist with over 30 years of experience in minerals exploration, analysis, and management. In 1974, he received his Bachelor of Science (Hons.) in Geology and his Masters of Science in Geology in 1975, both from McGill University. He received his Ph.D. in Geology from the University of Toronto in 1978 and became a registered Professional Geoscientist (P.Geo) in Ontario in 2002.

In 1978 at the young age of 35, he established Nuclear Activation Services Ltd., a partnership with McMaster University and the first commercial instrumental neutron activation laboratory in the world. In 1987,

Eric established Activation Laboratories Ltd. (Actlabs) Group of Companies with a focus on commercializing innovative technologies with the highest quality standards to the minerals, metallurgy, petroleum, life sciences, environmental, forensics, materials testing, and agriculture industries, achieving global success by building and running a company with 21 laboratories and 1000 employees in 10 countries. In 2014, Actlabs new 200,000 sq. ft. global headquarters was officially opened, a milestone for Actlabs growth and a symbol of how much he accomplished.

Eric received many honours and awards, including a 1971-72 JW McConnell Undergraduate Scholarship, a 1972-73 RPD Graham Undergraduate Scholarship; a 1973-74 Logan Undergraduate Scholarship; the 1974 Logan Gold Medal in Geology for Highest Standing and graduated with First Class Honours with Great Distinction; 1974-75, 1975-76, 1976-77, and 1977-78 National Research Council of Canada Postgraduate Scholarships; 1978-79 and 1979-80 NRC Post-Doctoral Industrial Fellowships; a 2009 Canadian Innovation Leader award from Government of Canada, and the 2013 Gold Medal from the Association of Applied Geochemists. The AAG Gold Medal was awarded in recognition of Eric's career as an industry leader in bringing novel analytical techniques to commercial fruition. He anticipated the evolving needs of the applied geochemist through technique design and instrument modification for a wide variety of sample media – key to longer term success as exploration has moved into progressively more difficult concealed terranes.

Eric was greatly admired and deeply respected by all who knew him. He was an excellent businessman, a great innovator, a valuable contributor to the geochemistry community, a champion of geochemical research, and an icon of the Canadian mineral exploration scene. Eric published consistently throughout his career, was always in attendance at scientific meetings to present and promote the latest in techniques and instrumentation in geochemical exploration. In addition to his close work with industry, hundreds of research papers in the peer-reviewed literature bear the mark of Actlabs' contributions and Eric's direct input. He was a strong supporter and sponsor of collaborative industry-university research projects in Canada and abroad. He will be missed by all who interacted with him for his drive and energy.

The Actlabs Team is committed to carrying-on Eric's dream and ensuring the success of Actlabs. We've put in place plans to ensure that the company stays strong and thriving, especially through these depressed times in the industry. We will continue to provide industry leading high quality analyses and innovative technologies as this is what Eric would have wanted.

A Memorial Scholarship at the University of Toronto was established in his memory. This Earth Sciences graduate scholarship will be able to help future students advance a field that Eric was so passionate about.

We miss him a lot, but his memory will never be forgotten and his legacy will live forever.

General Information

Sample Packaging & Shipping Instructions

The following advice will help ensure your samples arrive at the lab safely and avoid processing delays:

- Please limit sample shipping bags to a maximum weight of 18kg or 40 lbs each for the health and safety of everyone handling the bags during shipping and receiving
- Clearly identify samples with a unique identification number or name using waterproof ink on the sample bags and/or sample tags in the sample bags
- Securely package all samples and place them in your shipping containers (e.g. bags, pails or boxes) in order
- Submit samples in an organized fashion to avoid extra sorting charges and help get them in process sooner
- Sealed plastic bags are best for shipping pulps
- If using pop top vials or glass bottles, ensure that they are taped shut and protected from breakage
- Fill out a Request for Analysis Form (available from www.actlabs.com) as completely as possible and submit it with each batch of samples. Include the carrier or shipment method and the waybill number on the form to allow us to track delayed shipments
- Clearly identify all shipping containers with your contact information, the destination address, and sequential number. Place hard-copies of the Request for Analysis (RFA) Form and a sample list in the first shipping container and email digital copies to your destination lab to help get your samples in process sooner and ensure the accuracy of the sample ids in your report. Actlabs' receiving locations and general email addresses are listed on page 44 (back cover)
- Before shipping soils or vegetation samples from outside Canada to Actlabs in Canada, contact us for specific labelling and shipping instructions to avoid border delays
- This is not an exhaustive list, so please contact us with any questions, or to discuss your project requirements, as we are happy to help

Actlabs provides the following sampling supplies on request:

- Poly-weave shipping bags, heavy duty plastic sample bags, cable ties, and soil envelopes are available for a fee
- Complimentary shipping labels and sample tags

Quality Statement

Quality Assurance and Quality Control (QA/QC) is an integral aspect of our analyses and is a key component to Actlabs' vision, strategy and mission. Actlabs' Quality System monitors all steps and phases of our operations. Our Quality System outlines comprehensive details concerning our facilities, personnel qualifications, and processes used. Additionally, we are routinely audited by four regulatory agencies that focus on continual improvement. As a result, we continue to raise the bar with respect to the quality of our services in order to exceed their expectations and those of our clients.

Actlabs' Quality System is registered to international quality standards through the International Organization for Standardization / International Electrotechnical Commission (ISO/IEC) 17025:2017 (including ISO 9001:2015 and ISO 9002 specifications). Actlabs is accredited to the Standards Council of Canada (SCC) Requirements and Guidance for the Accreditation of Testing Laboratories, specific to mineral, forensic and environmental testing laboratories. The accreditation program includes ongoing audits which verify the Quality Management System and all applicable accredited test methods.

Report Formats

All reports and invoices will be emailed in PDF format and data sent in a digital format such as Excel or CSV to the email addresses that you specify on the Request for Analysis Form submitted with the samples. Custom report formats are also available so please contact us to discuss your specific requirements. Hard copies of reports or invoices are only available by special request and may incur additional cost.

Turnaround Time

Actlabs defines Turnaround Time (TAT) as the time from receiving a batch of samples at our laboratory with clear identification and analysis instructions, until we report the analysis results to you.

Routine TAT for a batch of samples depends on the number of samples, the preparation and analysis methods required, and current laboratory workloads; therefore, TAT may be variable based on the sample batch and the time of year submitted. Also, excessively wet samples or undocumented and / or unorganized shipments may slow down TAT. Contact us for a TAT estimate based on your planned project specifics or when you submit a batch of samples.

Priority or Rush TAT may be available depending on current laboratory workloads. If you require analysis results by a certain date, contact us to discuss your requirements before submitting the samples so we can confirm availability and what price surcharge is applicable. Once we have agreed on an estimated rush TAT, your samples will be prioritised, we will make every effort to report your results as close as possible to the agreed due date, and the agreed price surcharge will be applied.

WebLIMS

Clients can track their sample status from reception through logging, preparation, analysis and reporting, and access their final analysis results on-line, via secure login to our WebLIMS system. Please contact customerservice@actlabs.com to establish a WebLIMS account for your project.

For International Samples into Canada - Waybill Instructions: Mineral Samples for Analysis, No Commercial Value. Value for Customs: US\$5.00. Canadian Customs Tariff (Harmonized Code) 2617.90.00.00. Customs Broker: Thompson Ahern & Co Ltd.

Sample Preparation

Actlabs can advise on sample preparation methods to meet your project objectives. The selection of appropriate sample preparation methods and the quality of the process is critical for obtaining meaningful analytical results. Our standard preparation methods provide industry-leading quality through finer, more consistent, crushing; using mild-steel mills which do not introduce Cr or Ni; cleaning the pulveriser bowl with cleaner sand after each sample; and monitoring that crushing and pulverising particle size specifications are met. These steps provide more representative sub-samples and eliminate potential sample contamination for more accurate results.

Actlabs has implemented custom-designed robotic rock and core sample preparation that replicates and augments our manual sample preparation methods and provides the same quality with increased productivity and improved safety.

Our Sample Preparation pricing is all-inclusive including sorting, drying, labeling, crushing samples up to 7 kg, new reject bags, and sand cleaning of the pulveriser after each sample for peace of mind in budgeting and data quality.

Rock, Core and Drill Cuttings		
Code	Description	Price
RX1	Dry, crush (< 7 kg) up to 80% passing 2 mm, riffle split (250 g) and pulverize (mild steel) to 95% passing 105 µm	\$13.75
RX1-RTRN	Dry, crush (< 7 kg) up to 80% passing 2 mm, riffle split (250 g) and pulverize (mild steel) to 95% passing 105 µm. Supply and return processed crushed rock and pulverized material to client.	\$14.00
RX1-ORE	Dry, crush up to 90% passing 2 mm	add \$2.50
RX1+500	500 grams pulverized	add \$1.50
RX1+800	800 grams pulverized	add \$2.50
RX1+1000	1000 grams pulverized	add \$3.25
RX1-SD	Dry, crush (< 7 kg) up to 80% passing 2 mm, rotary split (250 g) and pulverized (mild steel) to 95% passing 105µm	\$13.75
RX1-SD-ORE	Dry, crush up to 90% passing 2 mm	add \$2.50
RX3	Oversize charge per kilogram for crushing	\$1.50
RX4	Pulverization only (mild steel) (coarse pulp or crushed rock) (< 800 g)	\$8.50
RX4-S250	Riffle split 250g and pulverize (mild steel) to 95% passing 105 µm	\$9.50
RX4-S500	Riffle split 500g and pulverize (mild steel) to 95% passing 105 µm	\$10.75
RX4-S1000	Riffle split 1000g and pulverize (mild steel) to 95% passing 105 µm	\$12.00
RX5	Pulverize ceramic (100 g)	\$23.25
RX6	Hand pulverize small samples (agate mortar & pestle) (<5g)	\$23.25
RX7	Dry, crush (<7 kg) and split (500g)	\$7.50
RX8	Sample prep only surcharge, no analyses	\$6.50
RX9	Compositing (per composite) dry weight	\$5.25
RX10	Weight (kg) as received	\$2.50
RX11	Checking quality of pulps or rejects prepared by other labs and issuing report	\$12.50
RX14	Core cutting	On Request
RX15	Special Preparation/Hour	\$86.50
RX16	Specific Gravity on Core	\$18.25
RX16-W	Specific Gravity (WAX) on friable samples	\$26.00
RX17	Specific Gravity on the pulp	\$19.25
RX17-GP	Specific Gravity on the pulp by gas pycnometer	\$20.50
RX18	Subsample split for 3rd party (up to 1kg)	\$3.75

Notes: Larger sample sizes than listed above can be pulverized at additional cost.
Code RX1-ORE is recommended for highly mineralised samples, providing finer crushing for a more representative sub-sample
Request code RX7 for preparation of samples requiring PhotonAssay analysis.

All soil, sediment and vegetation samples received from outside Canada require incineration prior to disposal under Canadian Food Inspection Agency (CFIA) regulations so incineration charges will apply as listed in the table below

Sample Preparation Packages

Humus and Vegetation		
Code	Description	Price
B1	Drying and blending humus	\$6.75
B2	Drying and macerating vegetation	\$10.75
B3	Dry ashing	\$13.00
B4	Washing vegetation	\$6.25
B5	Samples submitted in plastic bags, add	\$2.75
Special Digestion Procedures		
MDI	Microwave digestion - closed vessel	On Request

Sample Return, Disposal, and Storage

Please indicate on your Request for Analysis Form if your samples should be returned, disposed, or stored after analysis. Material is stored free of charge for a limited time after the date the final report is issued. If no instructions are received for sample return or storage, Actlabs reserves the right to dispose of the material after 3 months and disposal charges will apply. Material stored long-term will be subject to storage charges, billed quarterly. For returns, please include all necessary shipping information e.g., courier, account number, etc.

Irradiated material will be discarded 30 days after analysis unless prior arrangements are made. Return of radioactive material requires a Nuclear Safety Commission license. The cost per shipment of radioactive materials is \$200.00 plus shipping costs.

Code	Description	Price
H&R	Handling and retrieval of stored sample material	\$70.00 / hour
RTRN	Shipping cost (only if shipped on Actlabs account)	Cost + 15%
DISP1	Disposal of pulps to landfill site, per sample	\$0.40
DISP2	Disposal of reject to landfill site, per sample	\$1.25
INCIN	Incineration of soil, sediment and vegetation samples from outside Canada for samples up to 0.5 kg, per sample	\$1.00
	Additional charge for samples >0.5 kg	\$0.35 / kg
STORE 1	Monthly storage of rejects after 60 days, per sample	\$0.70
STORE 2	Monthly storage of pulps after 90 days, per sample	\$0.35
STORE 3	Monthly storage of sieve rejects after 90 days, per sample	\$0.35

Sample Preparation

Soils, Stream and Lake Bottom Sediments, and Heavy Minerals		
Code	Description	Price
S1	Drying (60°C) and sieving (-177 µm) save all portions	\$5.25
S1 DIS	Drying (60°C) and sieving (-177 µm), discard oversize	\$5.25
S1-230	Drying (60°C) and sieving (-63 µm), save oversize	\$6.75
S1-230 DIS	Drying (60°C) and sieving (-63 µm), discard oversize	\$6.25
S2	Lake bottom sediment preparation crush & sieve (-177 µm)	\$10.50
S3	Alternate size fractions and bracket sieving, add	\$3.50
S4	Selective Extractions drying (40°C) & sieving (-177 µm)	\$5.25
SGH-1	SGH drying (40°C) & sieving (-177 µm)	\$5.25
S5	Wet or damp samples submitted in plastic bags, add	\$2.50
S8	Sieve analysis (4 sieve sizes) coarser than 53 µm	\$91.75
S9	Particle size analysis (laser)	On Request

Portable XRF Analysis of Pulverised Samples

Portable XRF (pXRF) analysis of pulverised samples provides rapid, cost-effective, semi-quantitative results to assist with timely decisions in the field while traditional lab analyses are completed and can augment 4-acid digestion data to assist with rock characterisation.

pXRF analysis is extremely susceptible to sample matrix effects so for optimal accuracy of pXRF data, contact us to discuss project specific calibration and matrix matched Certified Reference Materials (CRMs).

These packages are only available when other multi-element analysis is requested on the same sample. Contact us to request additional elements or custom packages.

Analysis by pXRF requires 15g of pulverised sample but is non-destructive so the material can be used for additional analyses if needed.

Code pXRF-1: For mineralised samples		Code pXRF-2: For non-mineralised samples	
	Detection Limit	Element	Detection Limit
As	50 - 20,000 ppm	Al	0.5 - 10 %
Ca	0.5 - 10 %	Ba	100 - 50,000 ppm
Co	100 - 20,000 ppm	Fe	0.5 - 35 %
Cr	100 - 50,000 ppm	K	0.3 - 10 %
Cu	50 - 50,000 ppm	Mn	0.1 - 10 %
Fe	0.5 - 35 %	P	0.3 - 5 %
Mn	100 - 100,000 ppm	Si	0.5 - 35 %
Mo	100 - 50,000 ppm	Sr	100 - 10,000 ppm
Ni	50 - 50,000 ppm	Ti	0.1 - 10 %
Pb	50 - 50,000 ppm	V	100 - 10,000 ppm
S	0.1 - 10 %	Y	50 - 10,000 ppm
Zn	50 - 50,000 ppm	Zr	50 - 10,000 ppm
Price:	\$9.35	Price	\$9.35

Precious Metals Analysis

Gold and Silver Analyses - Geochem

Code	Method	Sample Weight (g)	Metric Range (ppb)	Price
1A1	Au Fire Assay – INAA	30	1 – 20,000	\$26.75
1A2	Au Fire Assay – AA	30	5 – 5,000	\$21.50
1A2B-30	Au Fire Assay – AA	30	5 – 10,000	\$22.00
1A2-50	Au Fire Assay – AA	50	5 – 5,000	\$24.75
1A2B-50	Au Fire Assay – AA	50	5 – 10,000	\$25.75
1A2-ORE	Ore Grade - Au Fire Assay – AA	30	0.01 – 100 ppm	\$24.25
1A2-50-ORE	Ore Grade - Au Fire Assay – AA	50	0.01 – 100 ppm	\$28.50
1A2-ICP	Au Fire Assay – ICP-OES	30	2 – 30,000	\$22.75
1A2-ICP-50	Au Fire Assay – ICP-OES	50	2 – 30,000	\$26.00
1A2-ICPMS	Au Fire Assay - ICP-MS	30	0.5 - 30,000	\$31.00
1A6	Au BLEG - ICP-MS	1,000	0.1 - 10,000	\$52.75
1A6-50	Au Cyanide Extraction - ICP-MS Ag or Cu add-on, for each additional, add	50	0.02 - 1,000	\$17.00 \$6.25
1A8-Au	Au Aqua Regia - ICP-MS	30	0.5 - 2,000	\$23.75
1E-Ag	Ag Aqua Regia - ICP-OES	0.5	0.2 - 100 ppm	\$9.25

For codes 1A6 and 1A6-50 with less than 5 and 15 samples, respectively, a \$250.00 setup charge will apply.

Use of 50g sample for fire assay may not provide optimum recovery.

For proper fire assay fusion, Actlabs may reduce the sample weights to 15g or smaller at its discretion

Gold and Silver Analyses - Assay

Code	Method	Sample Weight (g)	Metric Range (g/t)	Price
1A3-30	Au Fire Assay - Gravimetric	30	0.03 - 10,000	\$28.00
1A3-50	Au Fire Assay - Gravimetric	50	0.02 - 10,000	\$31.25
1A3-Ag (Au, Ag)	Au, Ag Fire Assay - Gravimetric	30	0.03 - 10,000 (Au) 3 - 10,000 (Ag)	\$35.75
1A4 *	Au Fire Assay - Metallic Screen	500	0.03 – 10,000	\$86.50
1A4-1000 *	Au Fire Assay - Metallic Screen	1,000	0.03 – 10,000	\$98.50
8-Ag	Ag Fire Assay – Gravimetric	30	3 - 10,000	\$31.25

* A representative 500 gram or 1000 gram (or customized) sample split is sieved at 149µm, with assays performed on the entire +149 µm fraction and two splits of the -149 µm fraction. It is important not to over pulverize the sample too finely as tests have shown gold will plate out on the mill and be lost. When assays have been completed on the coarse and fine portions of the bulk sample, a final assay is calculated based on the weight of each fraction.

When submitting samples for precious metals analysis, please provide at least 2-3 times the listed sample weight to allow for quality control analysis

PhotonAssay™

Code	Sample Weight (g)	Range (ppm)	Price
PhotonAssay	500	(Au) 0.03 – 350	\$25.75

* The presence of interfering elements such as Th, U and/or Ba in the sample matrix may increase the detection limit and decrease the precision.

Gold, Platinum, Palladium and Rhodium

Code	Method	Sample Weight (g)	Range (ppb)				Price
			Au	Pt	Pd	Rh	
1C-Exploration	Fire Assay - ICP-MS	30	2 - 30,000	1 - 30,000	1 - 30,000	-	\$30.25
1C-Research	Fire Assay - ICP-MS	30	1 - 30,000	0.1 - 30,000	0.1 - 30,000	-	\$39.25
1C-RhExp	Fire Assay - ICP-MS	30	-	-	-	5 - 10,000	\$38.75
1C-RhRes	Fire Assay - ICP-MS	30	-	-	-	1 - 10,000	\$48.75
1C-OES	Fire Assay - ICP-OES	30	2 - 30,000	5 - 30,000	5 - 30,000	-	\$25.75
1C-OES-ORE *	Fire Assay - ICP-OES	30	0.06 - 1000 g/t	0.01 - 1000 g/t	0.01 - 1000 g/t	-	\$43.25

* If >1000g/t use method code 8-Au, Pt, Pd (see Concentrate Testing on page 28)

Platinum Group Elements

Code	Method	Sample Weight (g)	Range (ppb)							Price
			Os	Ir	Ru	Rh	Pt	Pd	Au	
1B1	NiS Fire Assay - INAA	30	2-20,000	0.1-10,000	5-50,000	0.2-20,000	5*-100,000	2-100,000	0.5-20,000	1-2 samples \$415.00 3+ samples \$209.00
1B2	NiS Fire Assay - ICP-MS	30	-	1-10,000	1-10,000	1-10,000	1-10,000	1-10,000	1-10,000	1-2 samples \$413.00 3+ samples \$207.00

* Detection limits for Pt are increased with high Au/Pt ratios and limits for other elements will be affected by abnormally high Au, Sb and Cu content. Samples with high Au can be reanalyzed by Code 1C-Exploration or 1C-Research. Zn concentrates are not amenable to the nickel sulphide fire assay. Au results by Code 1B1 or 1B2 can be low by nickel sulphide fire assay. For accurate Au values, please request Code 1C-Exploration.

Exploration Geochemistry

Aqua Regia "Partial" Digestion

This digestion uses a combination of concentrated hydrochloric and nitric acids to leach sulphides, some oxides and some silicates. Mineral phases which are hardly (if at all) attacked include barite, zircon, monazite, sphene, chromite, gahnite, garnet, ilmenite, rutile and cassiterite. The balance of silicates and oxides are only slightly to moderately attacked, depending on the degree of alteration. Generally, but not always, most base metals and gold are usually dissolved.

Note: Results from acid digestions may be lab dependent or lab operator dependent. Actlabs has automated this aspect of digestion using a microprocessor designed hotbox to accurately reproduce digestion conditions every time.

Note: For Code Ultratrace 1, Code Ultratrace 2 and Code UT-1M, Au is semi-quantitative when using a 0.5g sample.

15g or 30g is recommend for soils, sediments and vegetation samples only.

Packages that involve 15g and 30g sample size will require RX10 (pulp weight report)

Package	ICP-OES (ppm)		ICP-MS (ppm)		ICP-OES + ICP-MS (ppm)
	1E	1E3	UT-1M	Ultratrace 1	Ultratrace 2
Ag	0.2 - 100	0.2 - 100	0.1 - 100	0.002 - 100	0.002 - 100

If Ag is >50ppm, assay by code 8-Ag is recommended (see page 8)
Extraction of each element by Aqua Regia is dependent on mineralogy
+ Sulphide sulphur and soluble sulphates are extracted

4-Acid "Near Total" Digestion

This acid attack is the most vigorous digestion used in geochemistry analysis and uses hydrochloric, nitric, perchloric and hydrofluoric acids. Even with this digestion, certain minerals (barite, gahnite, chromite, cassiterite, etc.) may only be partially dissolved or stable in solution. Other minerals including zircon, sphene and magnetite may not be totally dissolved. Most other silicates will be dissolved; however, some elements will be erratically volatilized, including As, Sb, Cr, U and Au.

Near-Total digestion cannot be used to obtain accurate determinations of REE, Ta, Nb, As, Sb, Sn, Hg, Cr, Au and U.

Aqua Regia "Partial" Digestion

- This leach uses a combination of concentrated hydrochloric and nitric acids to leach sulphides, some oxides and some silicates.

4-Acid "Near Total" Digestion

- This acid attack is the most vigorous digestion used in geochemistry analysis and uses hydrochloric, nitric, perchloric and hydrofluoric acids.

Extraction of each element by 4-Acid Digestion is dependent on mineralogy
+ Sulphide sulphur and soluble sulphates are extracted

INAA

Instrumental Neutron Activation Analysis
- Samples are encapsulated and irradiated in a nuclear reactor. After a suitable decay, samples are measured for the emitted gamma ray fingerprint. INAA is very good for Au, Co, As, Sb, W, Ta, U, Th, Cs, In, Re, Cl and lower levels of most LREE.

Key advantages of INAA include:

- Total determination of selected resistive and volatile elements, including Au
- Up to 30g of material can be analyzed for a more representative sub-sample
- Non-destructive, allowing material to be used for other analysis

Multi-Method Analyses

ICP-OES and ICP-MS analyses by 4-acid (hydrochloric, nitric, perchloric and hydrofluoric) digestion are “near total” digestions. INAA analysis yields total metals.

NOTE: Results from acid digestions may be lab dependent or lab operator dependent. Actlabs has automated this aspect of digestion using a microprocessor designed hotbox to accurately reproduce digestion conditions every time.

Extraction of each element by 4-Acid Digestion is dependent on mineralogy
+ Sulphide sulphur and soluble sulphates are extracted

Lithogeochemistry and Whole Rock Analysis

Lithogeochemistry

The most aggressive fusion technique employs a lithium metaborate/ tetraborate fusion. Fusion is performed by a robot at Actlabs, which provides a fast fusion of the highest quality in the industry. The resulting molten bead is rapidly digested in a weak nitric acid solution. The fusion ensures that the entire sample is dissolved. It is only with this attack that major oxides including SiO₂, refractory minerals (i.e. zircon, sphene, monazite, chromite, gahnite, etc.), REE and other high field strength elements are put into solution. High sulphide-bearing rocks may require different treatment but can still be adequately analyzed. Analysis is by ICP-OES and ICP-MS. Quality of data is exceptional and can be used for the most exacting applications. Values on internal replicates and standards are provided at no cost, as are REE chondrite plots. Eu determinations are semiquantitative in samples having extremely high Ba concentrations (> 5 %).

Mineralized Samples: Although intended primarily for unmineralized samples, mineralized samples can be analyzed. However, data may be semiquantitative for chalcophile elements (Ag, As, Bi, Co, Cu, Mo, Ni, Pb, Sb, Sn, W and Zn). For quantitative chalcophile data see add-ons below.

Code 4B: Lithium Borate Fusion / ICP-OES Whole Rock Package. Data meets or exceeds quality of data by fusion XRF.

Code 4B2: Lithium Borate Fusion / ICP-MS Trace Element package: Codes 4B2-STD and 4B2-Research both provide research quality data. 0.5 g required.

Research designation: indicates lower detection limits

Code 4 Litho and Code 4 Litho-Research: The 4B and 4B2 packages are combined. 5 g required.

For quantitative values of chalcophile elements, use code 4B1 or 4B-INAA. A minimum sample weight of 5 g is required. If submitting a pulp, please ensure sample is 95% passing 74 µm for any lithium borate fusion processes.

QUANT: If REE concentrations are greater than the upper limits shown on our website under package descriptions, we will dilute to quantify and apply the QUANT surcharge.

(+) Code 4B1: Optional elements by multiacid digestion. Please add 0.5 g. For reporting limits, see package 1F2 (page 10).

(++) Code 4B-INAA: Optional elements are available by INAA. Please add 0.5 to 30 g depending on sample size you prefer to analyze for Au with this option. For reporting limits, see package 1D Enhanced (page 12).

Add-ons	Surcharge
4B1	\$15.50

Research designation: indicates lower detection limits.

Code 4A-Research: Grades are determined by INAA. A minimum sample weight of 2 g is recommended. REE chondrite plots are provided at no charge.

- ‡ **Code 4A RES-MS:** elements indicated by ‡ are analyzed by fusion ICP-MS.

Code 4E: This package uses ICP and INAA technologies to completely characterize geological samples. This package is not suitable for analyzing concentrates or mill products. A minimum sample weight of 5 g is required.

Code 4E Add-Ons

- ‡ **Code 4E-XRF elements Ga, Pb, Sn, Nb and Rb** are determined by Pressed Pellet XRF. This package can be added to Code 4E exploration or Code 4E research (please add 6 g of sample).
- ‡‡ **Code 4E ICP-MS add-on option:** can only be added to Code 4E-Research grade.

Code 4F: Other analyses associated with WRA (can be added to any Code 4 package). Add 1 gram for each option chosen (see page 16).

All elements are in ppm except where noted. Prices per sample.

Lithogeochemistry and Whole Rock Analysis

Peroxide "Total" Fusion

Peroxide Fusions: Sodium peroxide fusion will result in a total metal recovery. It is effective for the decomposition of sulphides and refractory minerals. For nickel sulphide deposits this is the preferred method. This method is not suitable if sodium is required. Code 8 4-Acid is recommended if sodium is required.

Acid Rock Drainage

Code 11: Acid-Base Accounting: Acid Base Accounting (ABA) is used to make static measurements of Acid Rock Drainage potential. Measurements of total sulphur or sulphide sulphur are used to estimate the amount of acid bearing material. Using this information, the Neutralization Potential (NP), Acid Producing Potential (AP) and Net Neutralization Potential (Net NP) are reported.

The Sobek package is the original method described by Sobek for the US EPA. The Modified Sobek package is that by Lawrence and Wang. The Siderite correction package applies a method to limit the overestimation of Net NP in the Sobek method caused by the presence of siderite.

Code 11: Net Acid Generation (NAG)

A direct oxidation method used to estimate the acid forming potential of a sample. The sample is reacted with hydrogen peroxide to oxidize any sulphide minerals present. The sample must be acid generating and not acid neutralizing. This causes acid generation and acid neutralization to occur simultaneously, with the end result being a direct measurement of the net amount of acid a sample can generate. If the reacted sample has a pH of 4.5 or less it is likely to be acid generating. Titration of the mixture is used to determine the amount of acidity generated. False positive results may occur if a high organic content is present. In order to analyze for metals in the leachate a full second leach must be performed; therefore, the procedure will be charged twice.

Price per sample: \$175.00

Selective Extractions

Selective Extractions (SE) are a cost-effective method of finding blind mineralization through deep cover such as exotic overburden, lake beds, barren bedrock, or younger volcanic rocks. Very subtle trace element signatures have been added to soil above mineralization by elements migrating to the surface through a variety of mechanisms. Some traps for these signatures include Mn oxides, clay, carbonates, and organic material. Varieties of Selective Extractions target different trap types to release the signal of mineralization. A weaker leach is required to isolate the signal of blind mineralization from that of the overburden. Conventional partial leaches, like aqua regia extraction- ICP, extract metals from sulphides, oxides and silicates. This provides a partial composition of the overburden which will contaminate the signal of the buried mineralization. Pattern recognition is the key to proper interpretation of SE data, since anomaly patterns can be different from conventional geochemical data. Selective extractions have been shown to work effectively in both acidic and alkaline environments, and have been used successfully in desert, tropical, glacial and permafrost terrains.

Enzyme Selective Extraction (ESE) is one of the most discriminating of the selective analytical extractions in use today. This selective extraction targets amorphous mixed oxide coatings. By selectively removing the amorphous manganese dioxide from these coatings, the mixed oxide coatings collapse, releasing trapped trace elements. At this time, the greatest depth of penetration of ESE for a mineral deposit is greater than 800 metres.

Bioleach uses technology proprietary to Actlabs. Through years of research by Actlabs, supported by CAMIRO (Canadian Mining Research Organization) with our SGH technology, it has been proven that microbiological processes are exceptionally important. Electrochemical Redox cells mobilize metals from the mineral deposit to the surface which become adsorbed on soil particles and create unique surficial conditions that bacteria then feed upon. Bioleach digests bacteria and their proteins from the collected surficial samples to analyze for the elements related to the blind mineralization.

MIG (Mobile Ion Geochemistry) isolates the chemically active metal ions which were loosely adsorbed to soil particles. This is a weak leach that uses a solution of organic and inorganic compounds to extract target elements.

Preparation and Analysis

The recommended sample material is upper B-horizon soil sampled at a continuous depth. After materials are collected, they are air dried or dried in special rooms kept below 40°C. Samples then undergo the chosen SE under rigidly controlled conditions. The resultant solutions are analyzed by ICP-MS.

Sequential Leaches

Sequential leaches can target specific soil or rock phases and allow a better interpretation of the geochemical processes involved. A sample will undergo sequential leaching process starting with the weakest leach to the strongest leach with subsequent analysis of each of the leachates by ICP-MS.

Some of the potential leaches which can be combined sequentially include from the weakest to the strongest:

Code 7 - Deionized Water	This water soluble leach attacks any water soluble component or most labile bound components. The leach is not buffered and can be affected by buffering the sample mineralogy.	Code 7 - MIG Leach	For mobile metal components
Code 7 - Enzyme SE	Selectively goes after amorphous Mn oxides	Code 7 - Hydroxylamine Leach Cold	For amorphous Fe oxides and crystalline Mn oxides
Code 7 - Bioleach	A leach proprietary to Actlabs that has been designed	Code 7 - Hydroxylamine Leach Hot	For amorphous and crystalline Fe oxides and crystalline Mn oxides.
Code 7 - Sodium Acetate Leach pH 5	For exchangeable cations adsorbed by clay and elements co-precipitated with carbonates	Code 7 - Aqua Regia	Will leach sulphide species and clay minerals
Code 7 - Sodium Pyrophosphate Leach	0.1M leach for elements adsorbed by organic material (humic and fulvic components)	Code 7 - Four Acid	Will dissolve silicate remnant material

Price: \$49.25 / leach / sample (unless otherwise listed)

Note: There is a \$245.00 set-up charge per leach chosen if there are under 10 samples.

Add-ons:	Price

SGH is a proven innovation to look for mineralization under a wide variety of cover. It is a nano-technology that has been used successfully in over 1,100 surveys.

Please contact us at **SGH@actlabs.com** or **1.888.228.5227 (1.888. ACTLABS)** for more information and for a custom quotation.

Spatiotemporal Geochemical Hydrocarbons (SGH)

SGH is a dual-purpose geochemistry as it identifies and locates targets at depth as a vertical projection and has been used to successfully discover new previously un-drilled mineral deposits. SGH has been shown to be very robust to the use of different sample types even “within” the same survey or transect. This capability has been vital to the successful use of SGH in areas of difficult terrain. This enables the interpretation of a regular grid or set of transects as samples do not have to be missed due to the different sample types encountered.

Sample Type and Survey Design: A minimum of 50 sample locations per target is required to ensure that enough locations are used in a survey to obtain sufficient samples into background areas on both sides of small targets. More samples are recommended for large targets. SGH can also be used in regional surveys. Enough samples over both the target and background areas is critical in order to fully study the dispersion patterns or geochromatography of the SGH Pathfinder Classes of compounds. Samples should be “fist” sized (50-100 grams), can be drip dried in the field, and do not need special preservation for shipping.

Pricing for SGH: \$52.50 per sample. For large surveys volume discounts may apply, please inquire. Relative or UTM sample coordinates must accompany the samples when submitted to allow development of the SGH interpretation report. Please contact us to help you design your sampling program at no additional cost, in order to obtain the best possible SGH results for your survey. Pricing includes the delivery of an SGH interpretation report for one commodity type (e.g. Cu, Ni, Au, U, Kimberlite, etc.), for more complex targets (e.g. VMS, SEDEX, Polymetallic, IOCG, IOCGU, Cu-Au Porphyry, etc), **an extra price of \$525.00** is applied to cover the time for the additional interpretation required.

Sample preparation charges are additional (Code SGH-1).

SGH Case Study Examples *

SGH Copper-Nickel-PGE Case Study

SGH Nickel Case Study

* Many more case studies available; including for other commodities.

Tools for Buried Deposit Targets

Biogeochemistry

Code 2A - Humus

Code 2B - Vegetation: INAA provides a very cost effective, rapid means of analyzing humus or vegetation to very low detection limits for gold and many other elements useful for geochemical exploration. The organic material is dried below 60°C, macerated and a 15 g aliquot is compressed into a briquette and analyzed using Code 2A or Code 2B depending on whether the material is purely organic (Code 2B) or contains mineral matter (Code 2A). These briquettes are irradiated and their gamma ray spectra are measured and quantified. The advantages of this technique are simplicity (less chance of human error and contamination, ashing is costly and the results in loss of gold) and INAA is the technique with ultimate sensitivity for gold and other trace elements. Prices listed in Codes 2A and 2B are for standard 15 g briquettes. Selected elements may be available at lower costs.

Code 2C - Vegetation Ash INAA

Code 2C1 - Vegetation Ash-ICP-OES:

Prices for Code 2C1 for single element is **\$8.40** with each additional element costing **\$3.10**.

Code 2D - Vegetation Ash-ICP-MS: Some geologists prefer ashing samples at low temperature (480°C) and determining metals on the ash. This may be advantageous, particularly if base metals are also required for your gold project or for base metal exploration. Note when samples are ashed, there may be volatile loss of certain elements (Au, As, Br, Hg, Cd, etc). Results are reported on an as received basis. Code 2D uses a proprietary acid digestion on the ash followed by ICP-MS and extends the list of elements which are available. Not all elements may be total. This package can be quite useful for diamond exploration.

Code 2E: This package is similar to Code 2D but requires a different digestion of the plant ash to obtain Au, Pt and Pd to low levels. This method has been shown to be very effective for PGE exploration.

Code 2F: Dry vegetation samples are dissolved in acid and analyzed by High Resolution ICP-MS.

Code 2G: Dry vegetation samples are dissolved in acid and analyzed by ICP-MS.

Actlabs only ashes vegetation in dedicated vegetation ashing furnaces to avoid contamination.

Tools for Buried Deposit Targets

Hydrogeochemistry

All detection limits are in µg/L except where noted for naturally occurring waters with low TDS <0.05%

Code 6 is applicable only to natural waters with low total dissolved solid content (<0.05%). Any individual cations greater than the dynamic range of the ICP-MS will be reported as (>) unless the Overrange option is chosen. Samples submitted under all Code 6 packages (with exception of Code 6 Dissolved and Code 6 Total Recoverable mentioned below) will be analyzed on the supernatant portion of waters as received, acidified to pH <2 without filtration or digestion. The Code 6 Dissolved package includes filtration with 0.45µ filters while the Code 6 Total Recoverable Natural Waters package include water digestion according to EPA protocols. Samples will be analyzed on the supernatant portion of waters as received, acidified to pH <2 without filtration. For hydro samples being analyzed by ICP-MS or by Ion Chromatography, please include field TDS/conductivity measurements, if available.

Actlabs' unique High Resolution ICP-MS water package provides unrivaled sensitivities for hydrogeochemical surveys on natural waters with low TDS.

From Eppinger et al., 2013: 'Anomalous concentrations of Ag, In, Sb, Th, U, W fall in the exceedingly low ng/l concentrations ranges discernible only with the HR-ICPMS method'. Only HR-ICP-MS could see the deeply-buried Pebble Porphyry Copper Deposit.

Water: 'Lower determination limits for cations analyzed by HR-ICP-MS, a relatively new technique available commercially since around 2005, are commonly two and perhaps three orders of magnitude below those by standard ICP-MS. As a consequence, the resulting dataset is robust and has few highly censored elements (i.e., those with "less than" values), an unusual feature for water analyses. The lower determination limits for elements analyzed by HR-ICP-MS allow observation of element patterns at exceedingly low concentrations ranges.'

Note: The prices for these packages are on the next page.

Tools for Buried Deposit Targets

Hydrogeochemistry

The lab reserves the right to adjust the matrix of the samples to perform the testing required.

Code 6 - Hydrogeochemistry		
Package		Prices
Code 6 - Natural Waters with low TDS (<0.05%)	1-50 samples as received	\$58.25
	51+ samples as received	\$53.00
Code 6 - Total Recoverable Natural Waters with low TDS (<0.05%)	1-50 samples	\$74.75
	51+ samples	\$69.75
Code 6 - Dissolved Natural Waters with low TDS (<0.05%)	1-50 samples	\$74.75
	51+ samples	\$69.75
† Code 6 MB - Marine Water, Brines or other aqueous solutions with TDS > 0.05%		\$89.50
Code 6 Overrange - Overrange elements in Code 6 MB reanalyzed by ICP-OES or ICP-MS if required	add	\$21.75
Code 6 ICP-OES - Hydrogeochemistry ICP-OES for 36 elements		\$33.25
† Code 6 ICP-OES MB - Hydrogeochemistry ICP-OES for Marine Brines		\$49.75
Code 6 Hg - Hg(+) option on separate sample by FIMS	add	\$28.75
Code 6 Boron - Boron add-on by ICP-MS	add	\$8.50
Code 6 Filter - Samples filtered with 0.45µ filter	add	\$18.00
Code 6 EXPER - Where % RSDs are required (1-4 elements only)		\$75.75
Code 6 COC - Where Chain-of-Custody for legal defense is required		\$75.00
Code 6 Au HR-ICP-MS - Au by High Resolution ICP-MS		\$90.25
Code 6 HR-ICP-MS - Water analysis by High Resolution ICP-MS		\$138.00
Code 6 PGE HR-ICP-MS - PGE by High Resolution ICP-MS		\$106.00
Code 6 Acidify - With ultrapure nitric to pH <2		\$3.75

Samples submitted as natural waters, but with TDS >0.05% will be charged as 6MB.

Analysis of waste waters and other solutions are available, but at varying costs. Please inquire

† Detection limits for samples with high dissolved solids such as marine waters or brines, may be elevated by a factor of 10-1000.

Trihalomethanes (THM)		\$53.50
Turbidity		\$13.25

Ores, Concentrates, and Commodities

Ores, Concentrates, and Commodities

Ore-Assays

Assays provide quantitative determinations of elements in non-processed geological materials. Assays are usually required when samples are known or suspected to contain higher levels of metals. For lower levels, geochemical methods should be used. Prices listed in our fee schedule are for natural geologic materials and are not for metallurgical products. Metallurgical products such as tail samples and concentrates are handled separately to prevent contamination in the laboratory. These materials are charged at three times the prices listed in our fee schedule.

Note: Aqua Regia and 4-acid Assays may not be total due to the mineralogy present in the samples.

Note: Additional elements can be analyzed on request

Aqua Regia "Partial" Assay (Code 8-AR-ICP-OES)

For processed material, analysis is available upon request

Heavy Mineral Concentrates

Code 3A: Heavy Mineral Concentrates (Thermal Irradiation)

Heavy mineral concentrates prepared from reverse circulation drilling samples or from panned concentrates are expensive to collect. The nugget effect may require that the entire sample be analyzed to ensure that the few particles of gold which may be present can be measured. With INAA the whole concentrate can be analyzed without grinding the samples. The sample is therefore preserved for other chemical or mineralogical work. Actlabs only irradiates with thermal neutrons so as to avoid low gold values due to self-shielding effects from irradiation with epithermal neutrons. The price varies depending on the volume of concentrate to be analyzed.

There are 3 vial sizes available:

Small (2g) \$28.25 | Medium (20g) \$32.25 | Large (60g) \$38.75

Actual weight may vary depending on mineralogy.

Code 3C: HMC Base Metals by Aqua Regia ICP

When the analyses by INAA are completed, the sample is available to determine additional elements by other analytical techniques. Code 3C is a frequently requested Aqua Regia extraction ICP-OES package (0.5g required). First element price for Code 3C is **\$10.50** with each additional element costing **\$4.75**. All elements **\$17.50**. Code 3C may require the sample to be pulverized finer, if coarser than +177 µm at an additional cost

Coltan

Samples not requiring rare earths can be analyzed by fusion with lithium metaborate/tetraborate in platinum crucibles with the molten glass cast into a glass disc in platinum crucibles. These glass discs are analyzed by XRF. Generally low Ta₂O₅ detection limits can not be achieved with this package and the INAA technique is recommended for tantalum.

Rare Earth Elements

(Code 8 - REE Assay) Rare Earth Element-Niobium-Zirconium-Yttrium-Tantalum-Uranium-Thorium-Beryllium-Phosphate-Tin Assay ICP-OES and ICP-MS Package

Rare earths and rare elements are among the most difficult to analyze properly. It is essential that the sample be ground to 95%-200 mesh to ensure complete fusion of resistate minerals. The analysis requires a lithium metaborate/tetraborate fusion with subsequent analysis by ICP-OES and ICP-MS. Mass balance is required as an additional quality control technique and elemental totals of the oxides should be between 98 to 101%. In certain circumstances the presence of small amounts of phosphate will have very severe consequences to Nb₂O₅ assays by this method with results being very low for Nb₂O₅. Reanalysis is required for Nb₂O₅ by fusion XRF. In many cases these types of deposits may contain high amounts of fluorite. This should be noted on the Request for Analysis form or F assays should be requested. This will speed up processing as mass balance won't be achieved otherwise and a delay in returning results will ensue as samples get repeated.

IN NO CIRCUMSTANCES SHOULD AN ACID DIGESTION OF ANY TYPE BE USED TO EVALUATE THE ELEMENTS BELOW AS THEY WILL ONLY BE PARTIAL ANALYSIS.

Fusion ICP-OES & ICP-MS, Elements and Detection Limits (ppm, except where noted)			
\$86.50			
Elements	Detection Limits	Elements	Detection Limits
Al ₂ O ₃	0.01%	Rb	2
CaO	0.01%	Sb	0.5
Fe ₂ O ₃	0.01%	Sc	1
K ₂ O	0.01%	Sn	1

Ga	1	Gd	0.1
Ge	1	Tb	0.1
Hf	0.2	Dy	0.1
In	0.2	Ho	0.1
Mo	2	Er	0.1
Nb	1	Tm	0.05
Ni	20	Yb	0.1
Pb	5	Lu	0.04

If samples contain >0.3% P₂O₅, results may be semi-quantitative for Nb, Ta, Zr and Hf as results may be low by ICP-MS. Nb₂O₅ and ZrO₂ is recommended to be replaced by fusion XRF.

Add-ons:

Code 8 - XRF Nb₂O₅, ZrO₂ and Ta₂O₅ (0.003%) **\$25.75**

Code 4F - F (0.01%) by ISE **\$32.25**

Note: Chalcophile elements are semi-quantitative. An additional fee will be incurred if assays are required

Ores, Concentrates, and Commodities

Uranium

Code 8 - Uranium: Total uranium can be determined by delayed neutron counting using an automated system at a nuclear reactor. The principle advantage of this is to provide very rapid and accurate assays for high volumes of samples at a very low cost. The upper limit of this technique is 1% U. Results can be reported as U or U₃O₈. From 1 to 10% U₃O₈ fusion XRF will provide the best quality assay results and above 10% U₃O₈ titration is recommended for accuracy.

Acid digestion using both aqua regia "partial" and 4-acid "near total" digestion with ICP-MS is also possible but uranium in resistate phases (zircon, monazite, etc) may not be included in the assays. "Near Total" digestions may not be total for uranium depending on mineralogy. Hydrofluoric acid is used in the digestion and some uranium may be volatilized due to combination with the HF.

Code 8 - Uranium	Price
Code 5D - U ₃ O ₈ Assay DNC (0.1 ppm - 1% U ₃ O ₈)	\$20.25
Code 8 - U ₃ O ₈ Aqua Regia "Partial" Digestion by ICP-MS	\$21.75
Code 8 - U ₃ O ₈ Assay by XRF (0.005%- 10% U ₃ O ₈)	\$30.75
Code 8 - U ₃ O ₈ 4-Acid "Near Total" by ICP-MS	\$24.00
Code 8 - U ₃ O ₈ Titration (>10% U ₃ O ₈)	\$45.75
Geochem V, U by XRF Pressed Pellet	\$15.25

Radionuclides

Naturally-Occurring Radioactive Materials (NORM) consist of radioactive material that comes out of the earth's crust and mantle. Human activity results in increased radiological exposure. Industries, excluding uranium mining and all associated fuel cycle activities, are known to have NORM issues, include coal mining and combustion, oil and gas production, metal mining and smelting, mineral (rare earth, titanium and zirconium), fertilizer (phosphate), building and recycling.

Actlabs provides NORM radiological testing to determine whether materials meet the safe limits for handling, disposal and transportation. The following radionuclides are usually regulated under the NORM guidelines: **Uranium²³⁸ Series, Thorium²³⁰, Radium²²⁶, Lead²¹⁰, Thorium²³², Radium²²⁸, Thorium²²⁸ and Potassium⁴⁰.**

Solids and waters are analyzed using a Gamma Spectroscopy method for the NORM radioactive elements.

Code 14 - Radiochemical Test Packages

The following radiochemical tests are offered for both geological (solid, water, vegetation, sediment, soil and rock) and environmental materials.

Pricing available upon request

Nuclide	Method	Water - Detection Limit	Solid - Detection Limit	Price - Water	Price - Solid
Ra226	Alpha Spectrometry	0.005 Bq/L	0.01 Bq/g	\$256.00	\$297.25
Gross α, Gross β	L/B Alpha, Beta Counting	α = 0.05 Bq/L; β = 0.15 Bq/L	α = 0.05 Bq/g; β = 0.15 Bq/g	\$170.00	\$170.00
Pb210	L/B Alpha, Beta Counting	0.01 Bq/L	0.1 Bq/g	\$283.50	\$326.00
Po210	Alpha Spectrometry	0.01 Bq/L	0.01 Bq/g	\$248.50	\$291.00
Th230 and Th232	Alpha Spectrometry	0.01 Bq/L	0.01 Bq/g	\$283.50	\$326.00
Ra228	Beta Counting	0.01 Bq/L	0.04 Bq/g	\$283.50	\$326.00

Code 15 - Gamma Scan Method: Gamma Spectrometry

Nuclide	Detection Limit

Bi212	0.05 Bq/g
Bi214	0.1 Bq/g
Ac228	0.1 Bq/g
K40	1.0 Bq/g
Price:	\$187.00

MLA & QEMSCAN Services

Applied Mineralogy is a discipline of mineralogy by which the unknowns and problems encountered during different mining steps can be approached and solved. Applied Mineralogy can be used to characterize the ore body, identify and quantify target minerals and their associations, and reveal the liberation, locking and grain size of the favoured phases; The data provided by Applied Mineralogy is essential for ore characterization, optimizing recovery and mineral processing plans.

Geometallurgy is an integrated methodology and multi-disciplinary field which aims to add value to a mineral deposit or resource while looking ahead at risk- reduction, improved decision-making and cost-effective down-stream activities (e.g. development, pre-feasibility, feasibility and production). The objective of successful Geometallurgy is quality ore- characterization and establishing links and relationships between geology, mineralogy and processing characteristics.

For quantitative mineralogical analyses, Actlabs is equipped with FEI Quanta 650F MLA and QEMSCAN 650F instruments; they are state-of-the-art Scanning Electron Microscopes (SEM) with superior resolution and performance over typical SEM systems. The Field Emission Gun source makes for significantly higher resolution analysis relative to regular MLA and QEMSCAN technology. Actlabs' Quanta 650F MLA and QEMSCAN 650F provide rapid, automated, non-destructive quantitative micro analysis used for integrated mineralogical and petrographical analyses.

Actlabs offers mineralogical analysis of assay rejects, drill core, RC drilling chips, plant samples and most other forms of man-made and natural materials. MLA can be applied to precious metals (Au, Pt, Pd, Ag), base metals (Cu, Ni, Co, Pb, Mo, Zn), ferrous and non-ferrous raw materials (Fe, Sn, Mn, W, Ta, Nb, U and REE), mineral sands, and graphite bearing rock.

Deliverable services for Geometallurgy and Applied Mineralogy

Quantified Modal Mineralogy Analysis

A rapid and efficient solution for identifying and quantifying the minerals present with detection limit of 0.1%. The measurement can be done on both thin section and polished section.

Particle and Grain Data Analysis

This type of analysis provides information on texture variations, size distribution of the target minerals, as well as locking and liberation characteristics for the ore minerals. Theoretical grade/recovery curve and association of the ore mineral with the gangue is also provided by this analysis.

Specific Phase Search (Including specific packages for Gold and Silver minerals)

This type of analysis is suitable to find PGM, low-grade levels of ore minerals, and other low-grade minerals like gold and silver. Trace and pathfinder phases can also be characterized. Once trace phases have been identified, data such as grain size distribution, classified images and particle counts can be provided. Actlabs has extensive experience in mineralogical analyses of precious metals as well as the ore minerals. Using our FEG (Field Emission Guns) equipped QEMSCAN/MLA we are able to find and characterize fine micron-sized or sub-micron sized ($>0.3 \mu\text{m}$) Gold or Silver particles locked in the pyrites, quartz and other gangue minerals. We can perform total precious metal deportment using FEG.

SE/BSE Imaging & Spectrum

Field Emission Gun technology enables us to take high-quality Backscattered Electron (for textural) and Secondary Electron (for topographic) images. In addition, both our MLA and QEMSCAN are equipped with two BRUKER SSD EDS detectors. The combination of detectors with the high intensity bright FEG source provides rapid and therefore low-cost analysis for the customer.

Electron Probe Micro-analyzer

Whenever the major and minor elements of a mineral shall be identified and quantified with a high precision, EPMA in-situ analyses will be the solution. Actlabs has a procedure for oxides, silicates, sulphides and sulphates as well as alloys. EPMA analysis can be done in conjunction with MLA and QEMSCAN measurements as a complementary method.

Petrographic Analysis

For detailed description the rock, its mineralogy and textural relationships, as well as identification of the Coal components, Actlabs employs transmitted/reflected petrographic microscopy (Olympus BX52) on polished thin sections and polished sections.

For more details and quotation inquiries, please contact geometallurgy@actlabs.com.

X-Ray Diffraction

Most minerals are crystalline and therefore scatter X-rays in a regular, characteristic way dependent on their crystal structure. Each mineral produces a unique diffraction pattern and can be identified from that pattern like a fingerprint. Identification of minerals is made by comparing their diffraction patterns with a library of over 17,000 mineral patterns stored in the International Centre for Diffraction Data (ICDD). Detection limits depend on the sample. For geological material, it is estimated that the minerals present in less than 2% of the sample might not be detected. The samples for X-ray diffraction analysis are ground or milled to a fine powder and then hand pressed into the sample holder. Approximately 1cm³ of the material is sufficient for rock mineral analysis but smaller amounts can also be accommodated by using a low background holder.

Code 9	Price
Mineral Identification (semi-quantitative) - minerals are identified and their amounts determined using the Rietveld method	\$136.25
Mineral Identification (quantitative) - minerals are identified and their amounts determined using the Rietveld method Corundum is added to the sample as an internal standard in order to determine the amount of X-ray amorphous material	\$204.50
Mineral Identification (qualitative) - minerals are identified, however their amounts are not determined	\$102.25
Clay Speciation	\$261.25
Mineral Identification (Rietveld) + Clay Speciation	\$386.25

XRD Cluster Analysis

This is a statistical tool that groups XRD patterns into clusters based on the similarity of their peak and profile information, and it can be used to rapidly group large data sets into smaller clusters with more similar mineralogy. This has potential applications for mining and exploration, wherein clustering would highlight existing changes in mineralogy within a deposit. Clustering would also be useful for determining mineralogical variability within metallurgical processing samples that could inform methodology.

Some Useful Applications:

- Create a multidimensional compositional ore deposit maps or alteration maps
- Ore grade control

[Pricing available upon request.](#)

Laser Ablation ICPMS

Actlabs offers Laser Ablation ICPMS services for U-Pb dating and In-Situ Trace Elements analysis; the laser beam can analyze spots from 5 microns to 100 microns. It is recommended to use round polished sections or polished thick sections. A number of elements can be scanned at the same time. Some applications include: Analysis of trace elements in carbonate-rich matrices such as mussel shells, otholites, etc. and Rare earth elements scan in minerals.

Electron Microprobe Analysis

The electron microprobe is used to determine the major and minor elements compositions of minerals in polished sections. It is an in-situ microbeam instrument, like the SEM, but wavelength spectrometers (WDS) are used to detect the X-ray counts from the sample surface instead of the EDS. Unlike the EDS, which detects and counts the X-rays signals for all elements at the same time, the WDS counts X-rays signals for only one element at a time. The WDS can count many more X-rays for the specific element in the same length of time and hence is more accurate than EDS, and has a lower detection limit. The relative error for microprobe is +/- 1% with detection limit of around 100 .

All pricing is by request. Please contact geometallurgy@actlabs.com

Metallurgical Services

Actlabs offers a full characterization of the ore and evaluation and testing of ore processing and extraction methods. We use geometallurgy techniques to characterize the ore and forecast the behavior of the ore and gangue minerals during processing and optimize the recovery.

We offer bench-scale metallurgical testing which is customized and designed in consultation with each client and project. Services offered cover a wide range of precious metals, base metals and industrial minerals. Additional Services may become available on site and additional services including pilot plant tests are available through a partner service provider, please enquire.

Metallurgical services offered include:		Price
Code S6	Separating -2 micron material	On Request
Code S7mi	Methylene iodide heavy mineral separation specific gravity can be customized (100 grams)	On Request
Code S7w	Sodium polytungstate heavy mineral separation specific gravity can be customized (100 grams)	On Request
Sample Preparation	Custom preparation of small to bulk samples including compositing, blending and preparation of representative test sub-samples Customized crush and grind size	
Comminution	Crushing (Jaw & Roll) Grinding (Steel Ball & Rod, Ceramic Media) Bond Work Index Size Classification (Screening and Cyclosizing)	
Gravity Concentration	Centrifugal Concentration (Knelson) Shaking Table (Wilfley) Heavy Liquid Separation	
Flotation	Batch Flotation Kinetic Testing Locked Cycle Testing	
Hydrometallurgy	Bottle roll and tank leaching Cyanide, acid and alkaline leach CIL & CIP Activated Carbon Testing (Adsorption & Quality) Sequential Diagnostic Leaching	

All pricing is by request. Please contact metallurgy@actlabs.com

Isotopic Analysis & Geochronology

Isotopic Analysis

When submitting samples, please supply details on rock or mineral type and alteration.

Isotopic Analysis			
Code 10 A - Parameter	Amt. Required	Precision	Price
Pb - Isotopic analysis by HR-ICP-MS (Pb >15ppm) (1-10 samples)	~ 1 g	0.4 - 0.5%	\$257.00
Pb - Isotopic analysis by HR-ICP-MS (Pb >15ppm) (>10 samples)	~ 1 g	0.4 - 0.5%	\$189.75

C-14 - Accelerator Mass Spectrometry (AMS)	please inquire		\$800.00

Geochronology

The dating strategy depends on the type of formation (magmatic, metamorphic or sedimentary), the sample composition and the age of the formation. The concentration of the mother and the daughter isotopes, as well as the apparent age can be determined with high precision. In many cases, however, the determined age may not be the real age of the geological event. The apparent age may be affected by the post-depositional or post-formation history of the rocks. Natural contamination of chemical sediments with detrital material can also affect the results of dating of diagenesis.

There are some techniques and calculations which can "look through" the post formation event. These include isochron dating (K-Ar, U-Pb, Rb-Sr and Sm-Nd) or the step heating Ar-Ar technique of the K-Ar method. In the Ar-Ar technique, the K and Ar are measured on the same sample aliquot. First the sample is irradiated in a nuclear reactor, where fast neutrons convert some of the ^{39}K to ^{39}Ar . After irradiation, the Ar is released fractionally by incremental heating. The result is a series of apparent ages from which useful information about the geologic history and the age of the sample can be inferred. Specific techniques for dating clay fractions have also been developed.

Our geochronological services provide dating methods for all types of geological samples through use of modern analytical facilities.

For the dating of a monomineralic sample only tens of milligrams of sample are required. For rocks, a few hundred milligrams are typically used for analysis. Size of the rock sample required will vary considerably for mineral separation depending on which minerals must be separated and the amount and type of the accessory minerals present.

CODE 10B - Ages of geological formations or secondary events (i.e. alteration or metamorphism) can be determined through using K-Ar, (Ar-Ar), U-Pb, Rb-Sr or the Sm-Nd dating methods. These analytical procedures include several steps:

- dating method selection
- sample collection
- sample preparation, mineral separation and treatment
- irradiation of the samples in a nuclear reactor for the Ar-Ar technique
- high precision determination of the concentration of the mother and daughter isotopes by TIMS (thermal ionization mass spectrometry)
- apparent age calculation and interpretation of the results

Geochronology	
10 B - Services Offered	Description (All prices by request)
K-Ar dating	Rock fractions, clay fractions and separated minerals (e.g., biotite, hornblende, sericite, K-feldspar, illite, glauconite, etc.)
K-Ar dating in duplicate	Two independent measurements on one sample
^{40}Ar - ^{39}Ar step heating dating	Rock fractions, clay fractions or separated minerals (e.g., biotite, hornblende, sericite, K-feldspar, illite, glauconite, etc.)
U-Pb dating by Laser Ablation	Single grain analysis (e.g., zircon, monazite, titanite, apatite)
Rb-Sr dating by TIMS	Isochron dating whole rock and minerals
Sm-Nd dating by TIMS	Isochron dating whole rock and minerals
Re-Os dating	Re-Os dating
Petrographic description	Includes thin section preparation
Mineral Separation	Specific mineral phases are separated to provide best data for age dating

Discounts may be applicable for large dating programs. Contact geochronology@actlabs.com for more information

Mine Site Laboratories allow you to receive a range of Actlabs services on site at your exploration or mining facility. Our mine site laboratory services are custom designed to suit the requirements of your project.

Custom Mobile Sample Laboratories

For those projects that have logistical barriers or it's more economical to process samples on-site, Actlabs Mobile Sample Laboratories is your solution. Actlabs can provide and deliver a complete turnkey package to operate an on-site preparation or complete laboratory anywhere in the world. The construction and operation of remote sample testing facilities requires very robust choice of equipment to ensure reliability and to minimize downtime. These labs, with state-of-the-art equipment and supplies, can be configured and supplied very quickly as Actlabs maintains a stock of new equipment for custom mobile labs.

Some equipment which may be employed in mobile sample labs include:

- Jaw crushers
- Pulverizers
- Splitters (Riffle or Rotary)
- Dust collectors
- Drying ovens
- Core saws

In order to recommend the best solution for your project, we require the following information:

- Type of Analysis Required
- Size and Type of Sample
- Number of samples to be processed per day (maximum and minimum)
- How long the program will operate

Our experienced Mobile Laboratory Team can provide Standard or a customized solution based on your project requirements and is 'Fit for Purpose'. Contact our Client Service Team to discuss your project needs and how Actlabs Custom Mobile Laboratories is the right fit for you; mobilelabs@actlabs.com.

Mine Site Laboratory Services

Mine site laboratories allow you to receive a range of Actlabs services on site at your mining facility. Our mine site laboratory services are fit for purpose and designed to suit the requirements of your project.

At Actlabs we:

- Design and build new mine site labs for sample preparation and/or analytical services
- Optimize existing mine site labs
- Expand mobile sample preparation facilities into full-service labs.
- Operate and maintain mine site labs
- Perform Laboratory audits
- Offer training and consulting

Terms and Conditions

Fees and Payment

- a) All prices in this pricelist are exclusive of GST/HST, are in Canadian dollars and apply only to clients submitting samples from Canada
- b) These prices apply to most geological materials for routine analyses. A surcharge may apply for abnormal matrices or non-routine analytical requirements. The client will be advised of any such conditions prior to performing the analytical work.
- c) A minimum charge of \$100.00 will be effective on all orders. A fee of \$75.00 will be charged if a Chain of Custody form is required.
- d) Payment should accompany the order unless credit has been established. Terms are net 30 days.
- e) Prices and packages are subject to change without notice.
- f) Customers are responsible for paying bank charges and should not be deducted from the total amount of the invoice.
- g) Please select OUR under Details of Charges when paying by direct bank deposit (EFT).
- h) Clients can pay invoices by cheque, bank draft, Visa, Mastercard, AMEX or direct bank deposit (EFT). To pay by credit card, a signature is required - either in the original paperwork or sent by fax or e-mail. We also require the security code found on the card. If paying by Western Union please add a surcharge of 10% to your payment.
- i) Any customs or shipping charges incurred while shipping samples to Actlabs is the responsibility of the customer, unless specified otherwise.

Liability

- a) Any analysis, testing, inspection or investigation in connection with any work performed by Activation Laboratories Ltd. shall be conducted in accordance with recognized professional analytical standards. Neither Activation Laboratories Ltd., nor its subcontractors, consultants, agents, officers or employees shall be held responsible for any loss or damage resulting directly or indirectly from any default, negligence, error or omission. While every effort will be taken to store the unused portion of your samples, Activation Laboratories Ltd. cannot bear any responsibility for loss or damage, regardless of the cause.
- b) The liability, if any, of Activation Laboratories Ltd. shall be limited to the cost of performing the analyses.
- c) Governing law shall be in the Province of Ontario, Canada.

Services

- a) We reserve the right to subcontract work to affiliated laboratories.
- b) It is the responsibility of the client to determine the suitability of any services provided by Activation Laboratories Ltd.

Confidentiality

- a) All data derived on client's samples is confidential only to the client and cannot be disclosed to other parties unless approved in writing by the client. In the event of demands by regulatory bodies data may be released to them if subpoenaed. Actlabs will inform and obtain consent in advance from the customers for the information the laboratory intends to make public.

For direct bank deposit,

Useful Information

Geochemistry vs. Assays

Geochemistry analysis provides an expected precision of +/- 20% at $\geq 100\times$ the detection limit. This type of analysis is for trace levels of metals and base metals generally less than 1%.

Assays analyses are for ore reserve calculations and can measure higher levels of metals and with increased precision of +/- 2-3% at greater than 100x the detection limit. For major elements the precision is expected to be +/- 1-2% at greater than 100x the detection limit.

Chemical Conversions		
Element	Compound	Factor
Al	Al ₂ O ₃	1.889
Ba	BaSO ₄	1.699
Ca	CaO	1.399
CaO	CaCO ₃	1.785
CaO	CaSO ₄	3.397
Ca	CaF ₂	1.948
CaO	CaF ₂	1.392
Cr	Cr ₂ O ₃	1.462
Fe	FeO	1.286
FeO	Fe ₂ O ₃	1.111
Fe	Fe ₂ O ₃	1.43
K	K ₂ O	1.205
Li	Li ₂ O	2.1527
Mg	MgO	1.658
Mn	MnO	1.291
Mo	MoS ₂	1.668
Na	Na ₂ O	1.348
P	P ₂ O ₅	2.291
Rb	Rb ₂ O	1.0936
S	SO ₄	2.996
Sr	SrSO ₄	2.096
Th	ThO ₂	1.138
Ti	TiO ₂	1.668
U	U ₃ O ₈	1.179
W	WO ₃	1.261
V	V ₂ O ₅	1.785
Zr	ZrO ₂	1.35

Common Tyler Sieve Sizes	
Mesh	Aperature (µm)
10	2,000
20	841
35	500
60	250
80	177
100	149
150	105
170	88
200	74
250	63
270	53
325	44
400	37

Common Drill Core Sizes		
Size	Core Diameter (mm)	Core Volume Per Meter Length (m ³ x10 ⁻³)
AQ	27.0	0.57
TT	35.0	0.96
BQ	36.4	1.04
NQ	47.6	1.78
HQ	63.5	3.17
BQ3	33.5	0.88

Core weight per metre (kg) =
Core volume per metre x specific gravity

Gold Conversion Factors	
1 ppb	0.001 g/t
1 ppm	1 g/t
1 oz/ton	34.286 g/t
1 gram/tonne	0.0292 oz/ton
1 gram/m3	0.0421 oz/yd3

Grain Size (Diameter)	
Gravel	2 to 4 mm
Sand	63 µm - 2 mm
Silt	4-63 µm
Clay	<4 µm

Pulverization Contaminants Added	
Mill Type	Contaminant Added
Mild Steel (best choice)	Fe (up to 0.2%)
Hardened Steel	Fe (up to 0.2%), Cr (up to 200 ppm), trace Ni, Si, Mn and C
Ceramic	Al (up to 0.2%), Ba, trace REE
Tungsten Carbide	W (up to 0.1%), Co, C, Ta, Nb and Ti
Agate	Si (up to 0.3%), Al, Na, Fe, K, Ca, Mg, Pb

(amount added depends on hardness of material and particle size required)

Ore Content	
1% Cu	2.89% CuFeS ₂ (chalcopyrite)
1% Mo	1.67% MoS ₂ (molybdenite)
1% Pb	1.15% PbS (galena)
1% U	1.18% U ₃ O ₈ (pitchblende)
1% W	1.26% WO ₃ (scheelite)
1% Zn	1.49% ZnS (sphalerite)
1% Fe	2.15% FeS ₂ (pyrite)
1% Fe	1.57% FeS (pyrrhotite)
1% Fe	1.38% Fe ₃ O ₄ (magnetite)
0.1% U ₃ O ₈	2 lbs/ton U ₃ O ₈
